

# SITE CHARACTERIZATION FOR CO<sub>2</sub> STORAGE FROM COAL-FIRED POWER FACILITIES IN THE BLACK WARRIOR BASIN OF ALABAMA

Jack C. Pashin, Geological Survey of Alabama

Peter E. Clark, Andrew M. Goodliffe, and

Eric S. Carlson, University of Alabama

Mason Tomson, Rice University

## DE-FE0001910

# PROJECT TEAM

- ✓ University of Alabama (Lead)
- ✓ Geological Survey of Alabama
- ✓ Rice University
- ✓ Southern Company, Alabama Power
- ✓ Schlumberger Carbon Services
- ✓ Micro-g Lacoste
- ✓ Halliburton/Pinnacle Technologies
- ✓ SECARB
- ✓ University of Alabama at Birmingham

# DURATION AND BUDGET

## ✓ Performance Period

- December 8, 2009 to December 7, 2012
- Divided into three equal budget periods

## ✓ Budget

- Total project cost — \$17,410,794
- Government share — \$9,849,924
- Cost share — \$7,560,870

# PROJECT GOALS

- ✓ Analyze the CO<sub>2</sub> storage capacity and injectivity of stacked saline formations in the Cambrian-Pennsylvanian section of the Black Warrior basin.
- ✓ Assess the risks associated with geologic carbon storage in the Black Warrior basin.
- ✓ Develop a regional plan and BPM for carbon sequestration.

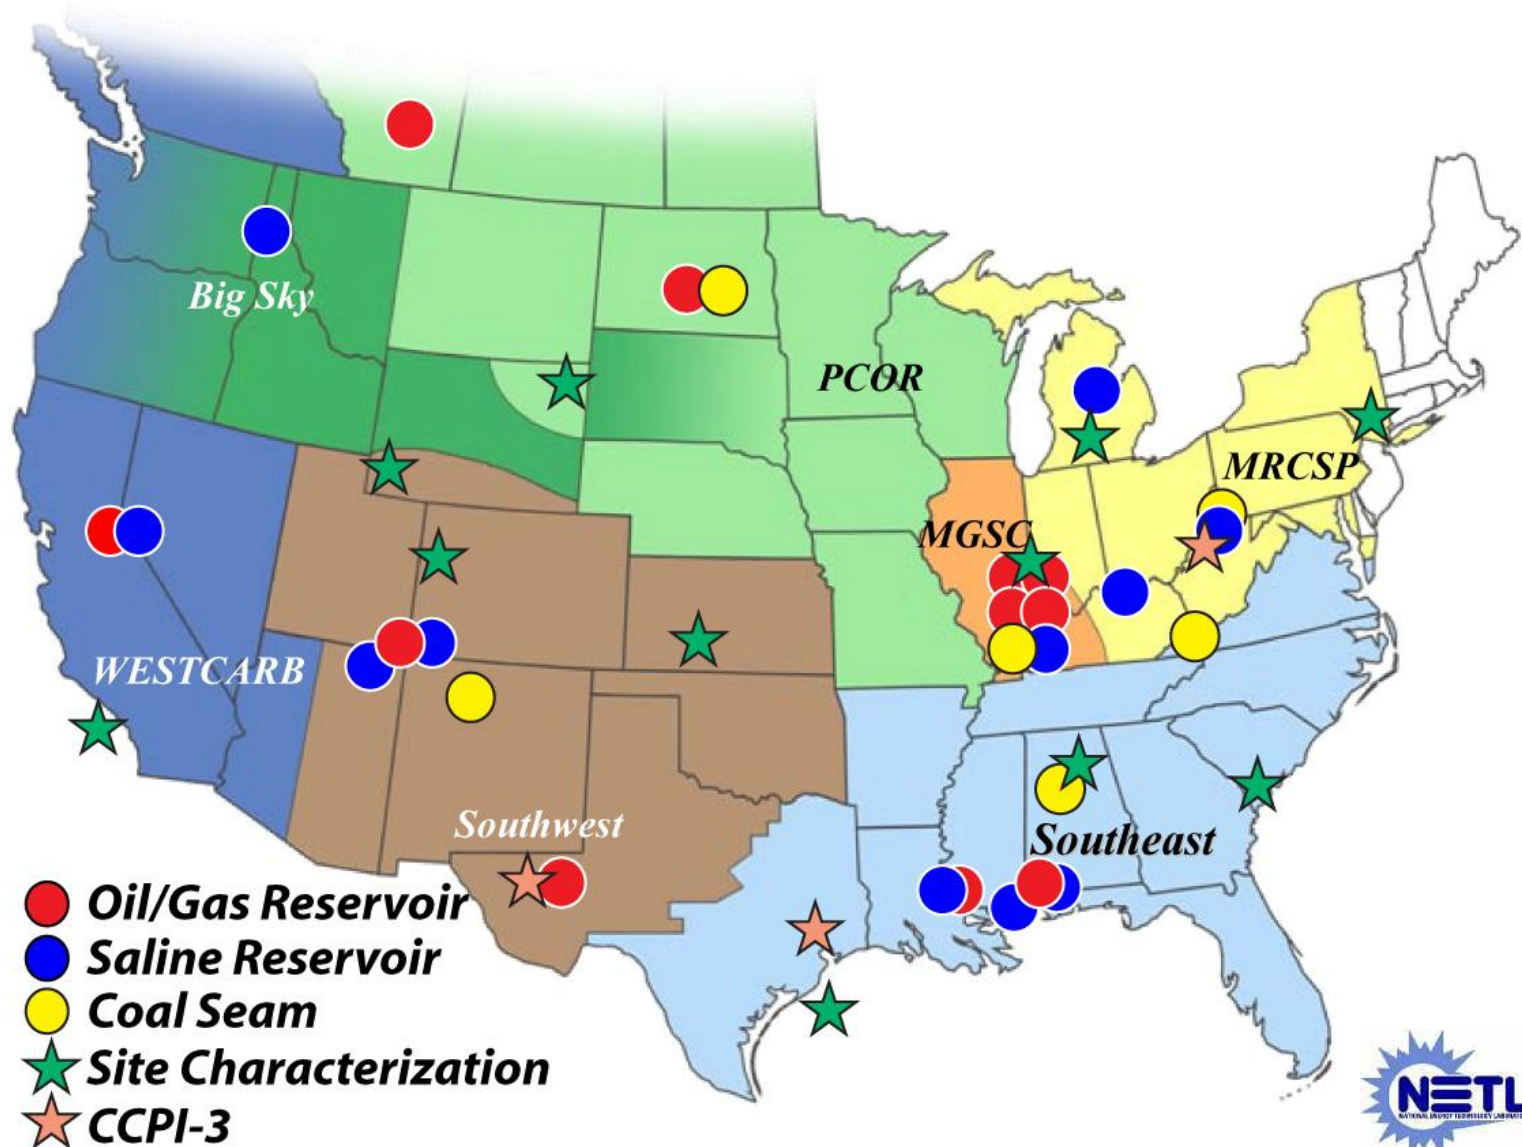

# PROJECT OBJECTIVES

- ✓ Assess saline reservoirs, O&G reservoirs
- ✓ Shoot 2-D seismic profiles
- ✓ Drill 8000-ft well at Plant Gorgas
- ✓ Core reservoirs and seals
- ✓ Quantify reservoir properties using
  - Advanced petrophysical and geophysical techniques
  - Injection/well testing
  - Integrity testing using mini-fracs
- ✓ Analysis of mineralization, dissolution, seals
- ✓ Reservoir simulation
- ✓ Develop best practices manual
- ✓ Leave infrastructure at plant

# BLACK WARRIOR BASIN

## Storage opportunities

# CHARACTERIZATION AREA, BLACK WARRIOR BASIN

# PRELIMINARY CAPACITY ESTIMATE

Formation	Areal extent (mi <sup>2</sup> )	Net Pay (ft)	Porosity (%)	Capacity (tonnes/mi <sup>2</sup> )	Regional capacity (gigatonnes)
Pottsville Formation**	9,400	260	18	2,031,969	19.1
Parkwood Formation	2,820	48	15	312,611	0.9
Bangor Limestone*	5,640	50	15	325,636	1.8
Hartselle Sandstone*	5,640	72	15	468,916	2.6
Lewis Sandstone	2,820	27	15	175,844	0.5
Tuscumbia Limestone*	5,640	90	15	586,145	3.3
<b>Total</b>				<b>3,901,121</b>	<b>28.2</b>

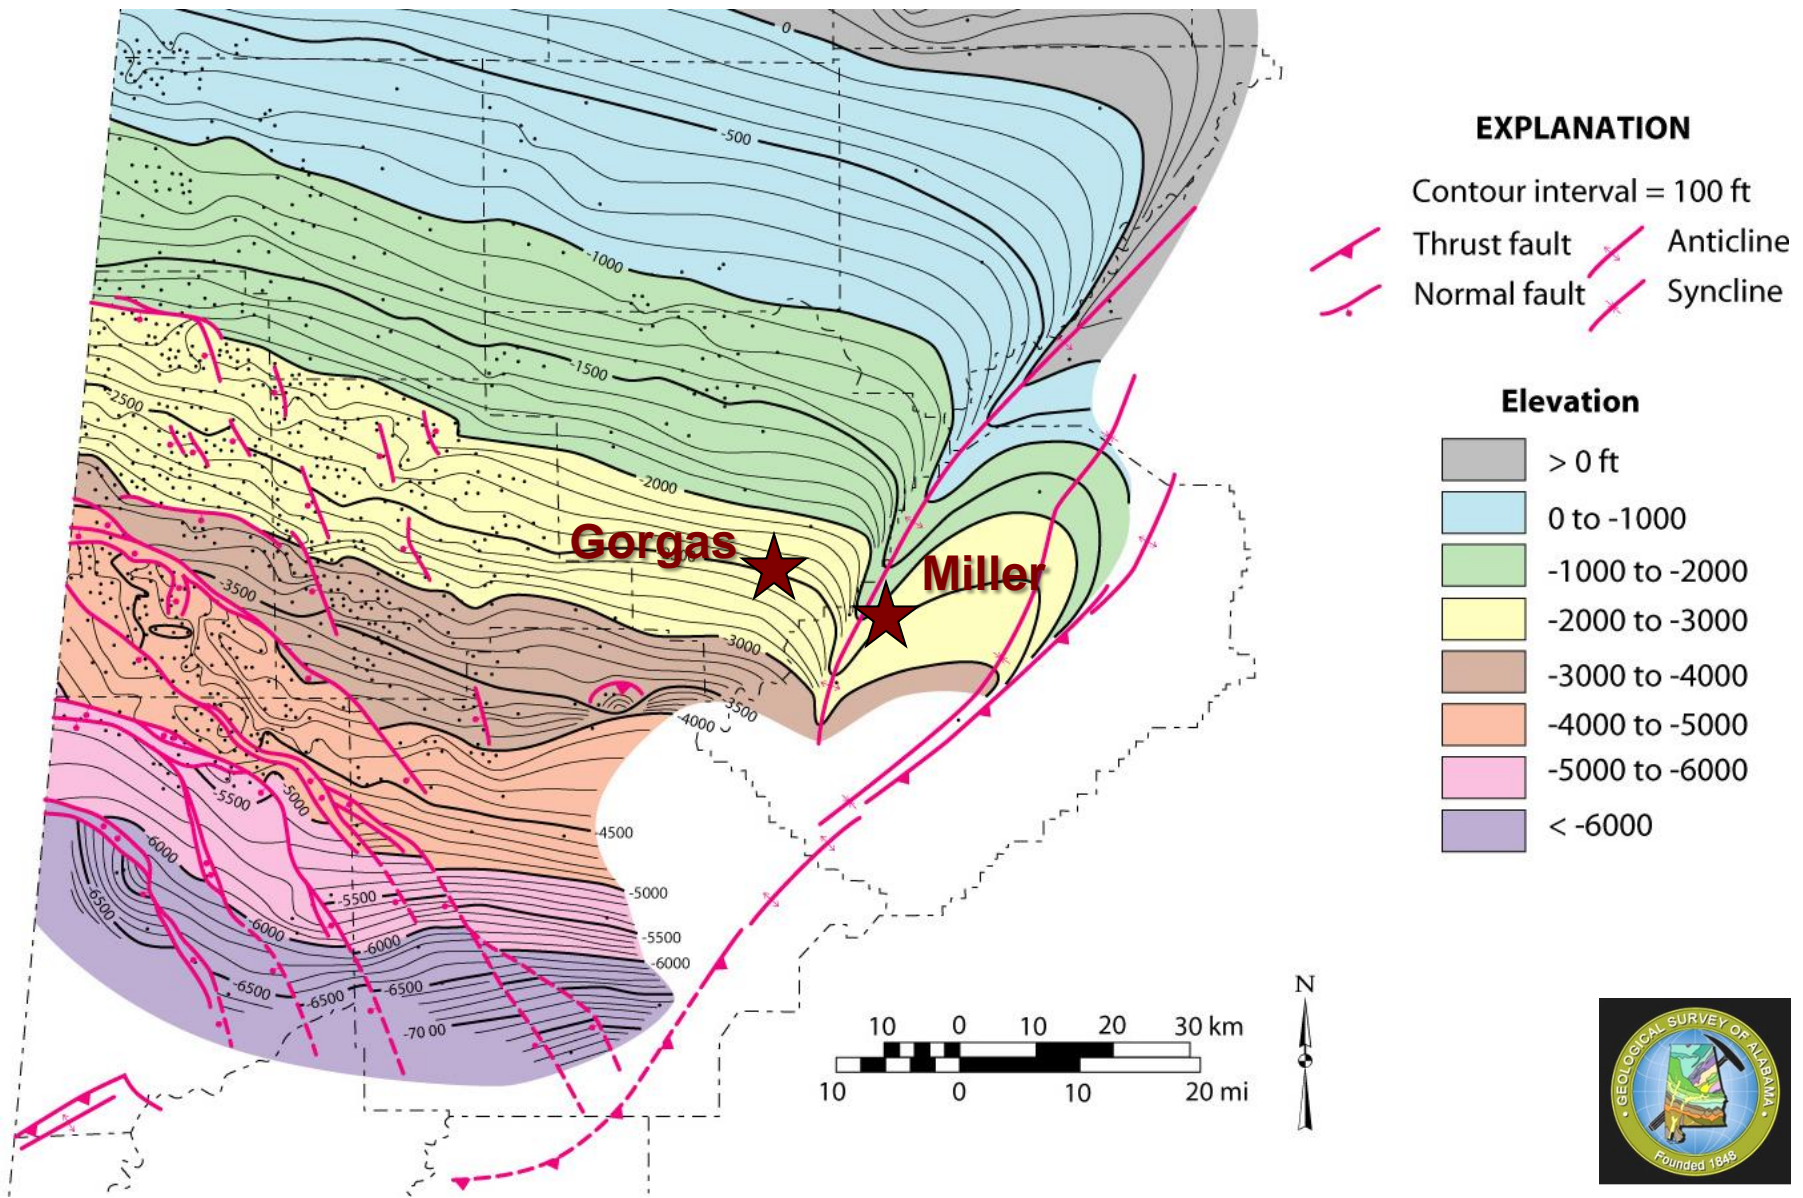

\* Saline formation present at test site

\*\* Shallower than 2,480 feet at test site.

## Rock Types

## Stratigraphic Markers

# CARBONIFEROUS SANDSTONE

Tangential cross-bedding

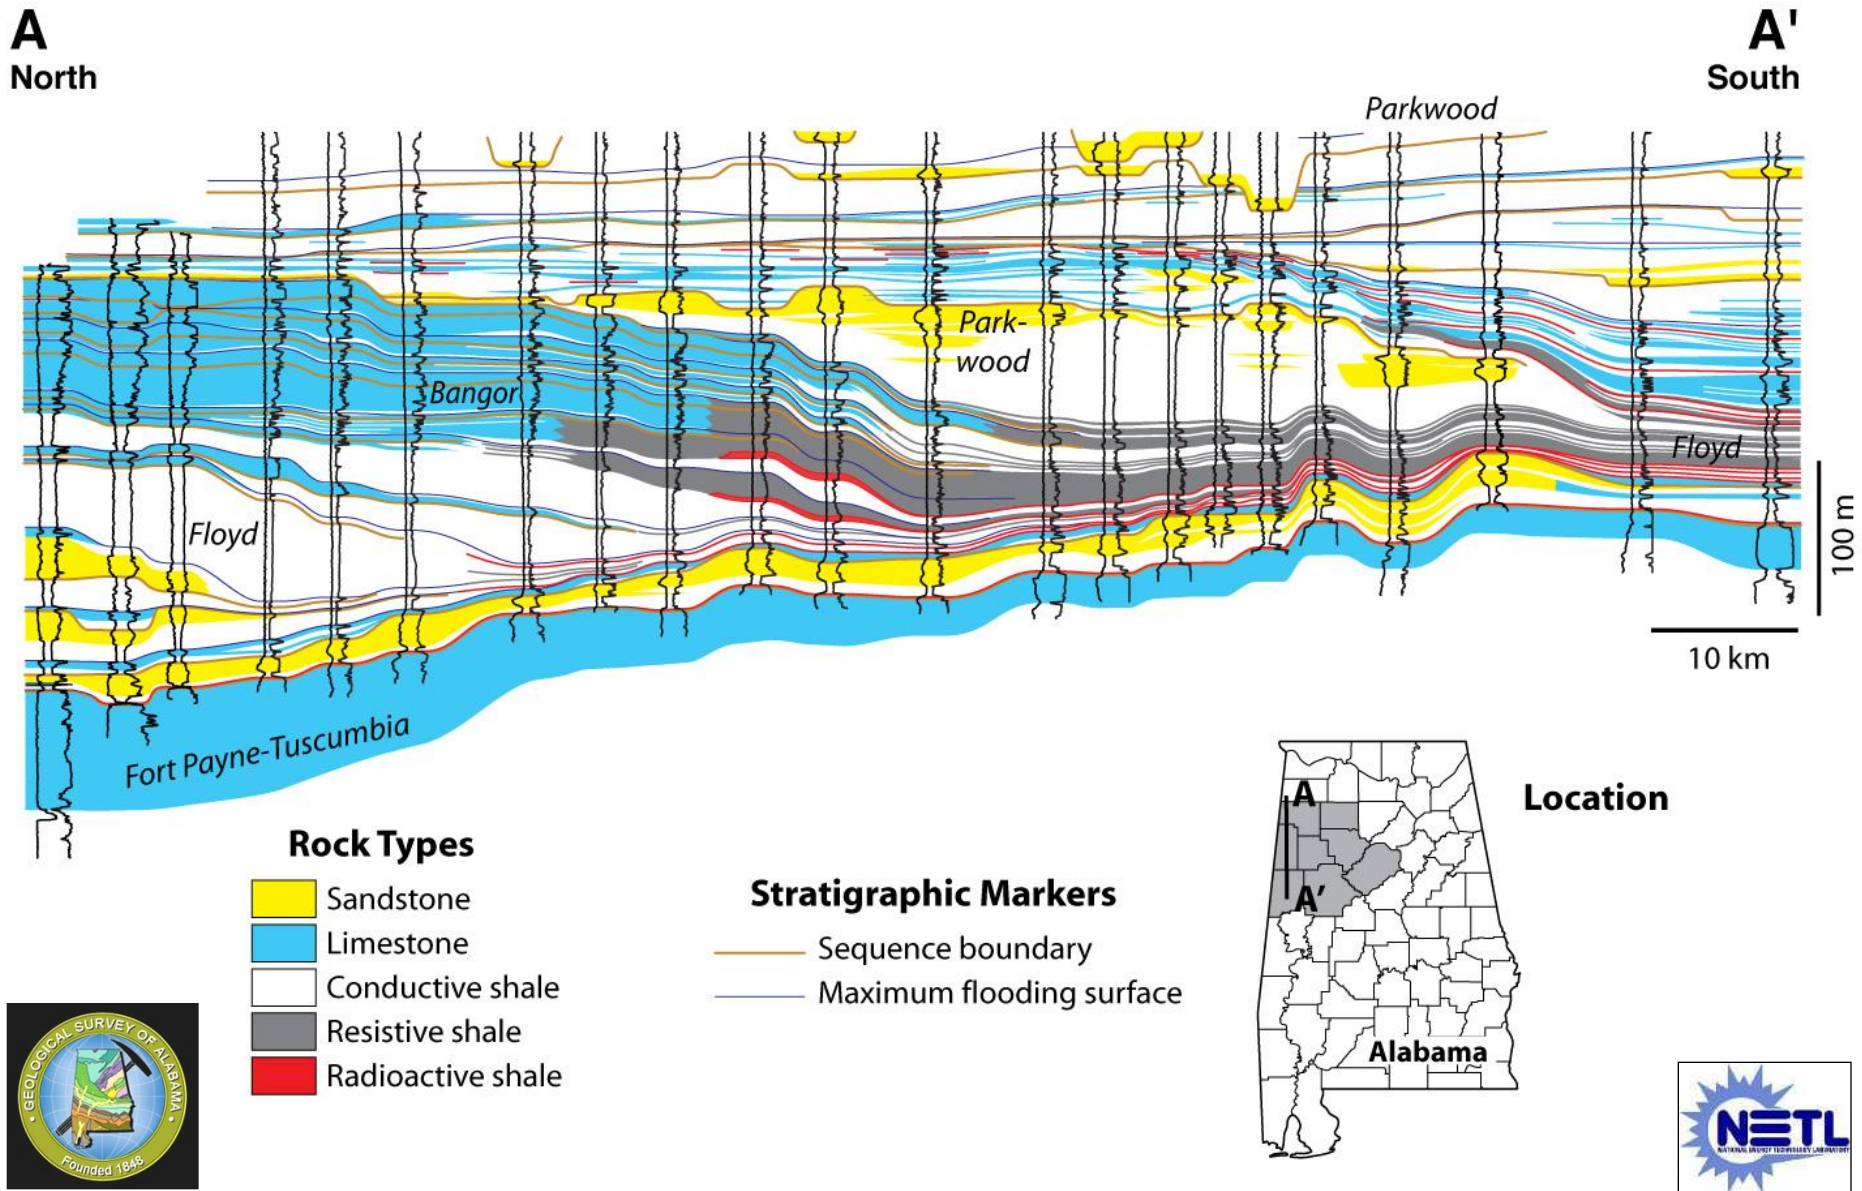

Wedge-planar cross-bedding

# MISSISSIPPIAN STRATIGRAPHY

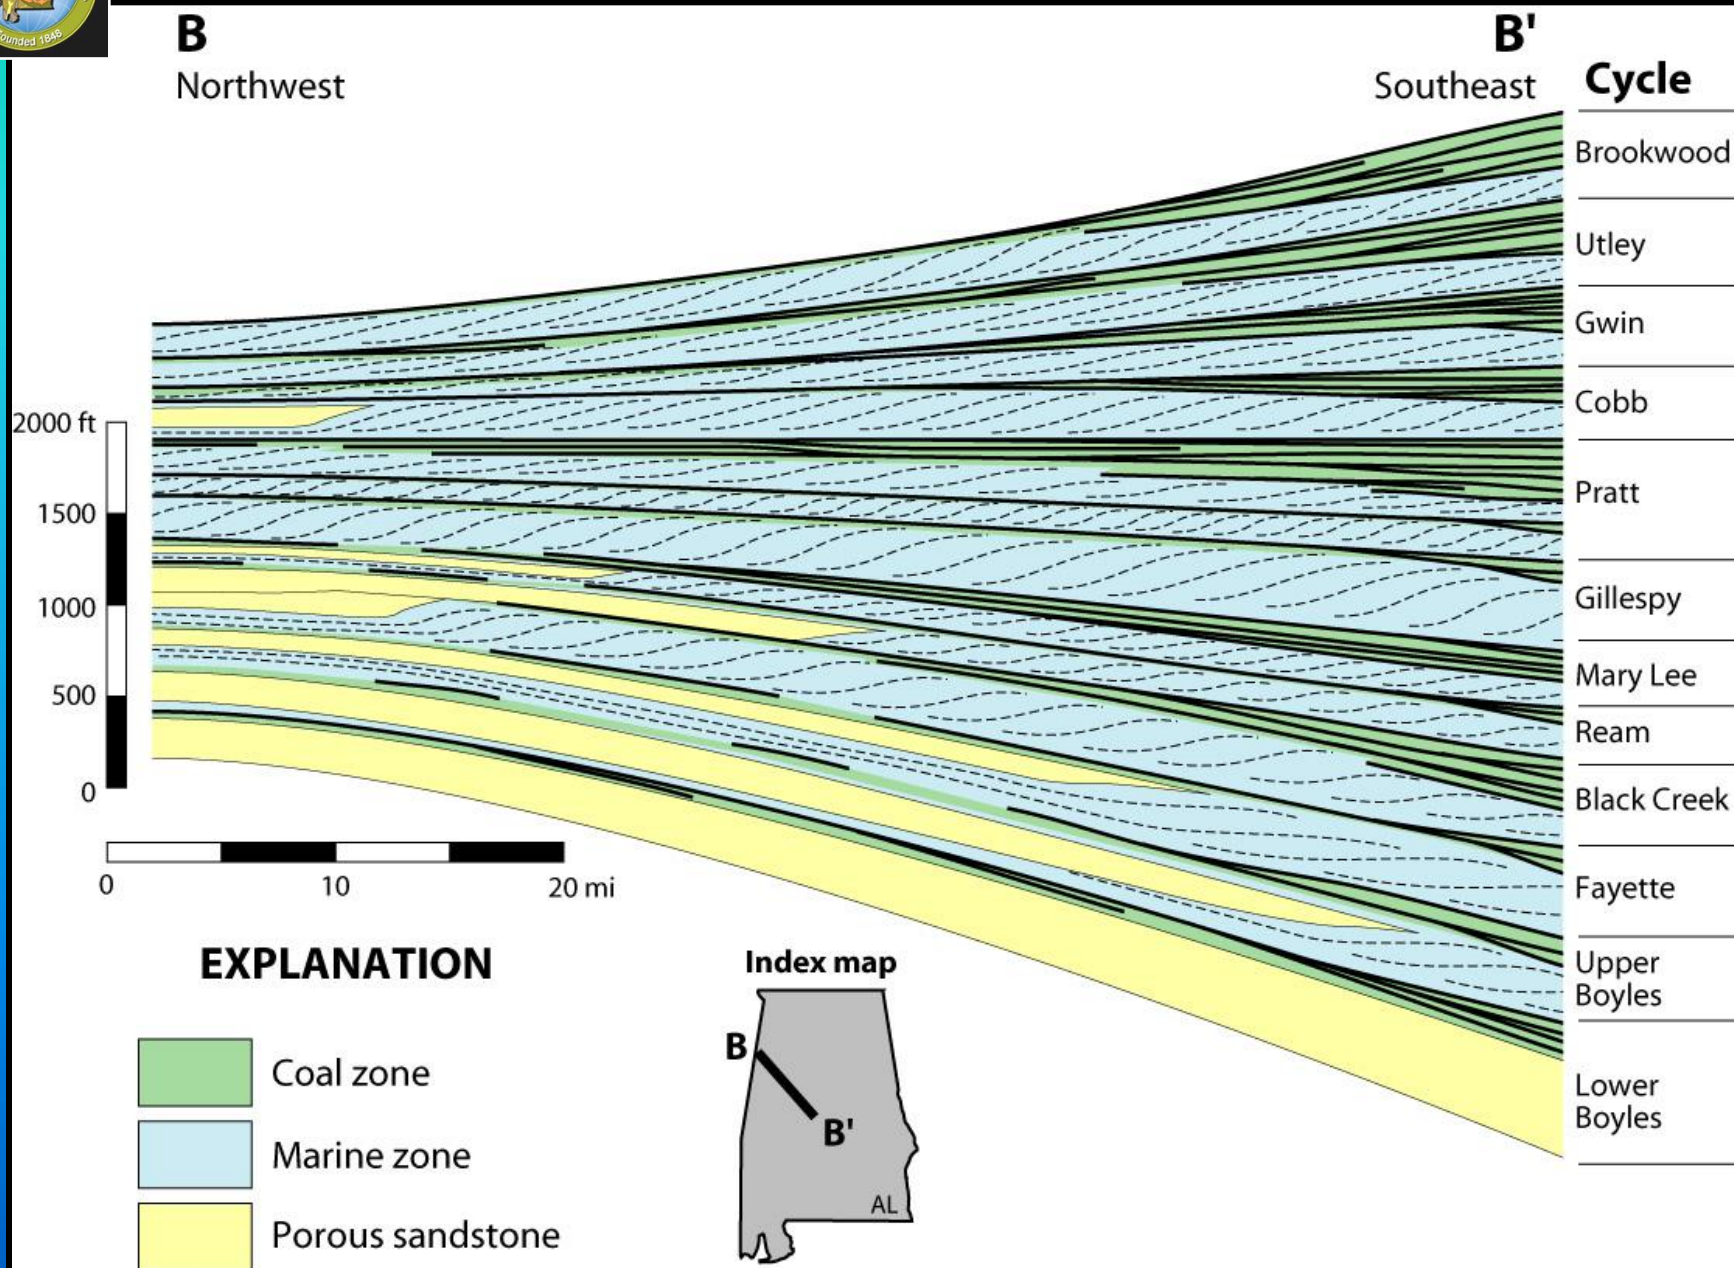

# IDEALIZED POTTSVILLE CYCLOTHEM

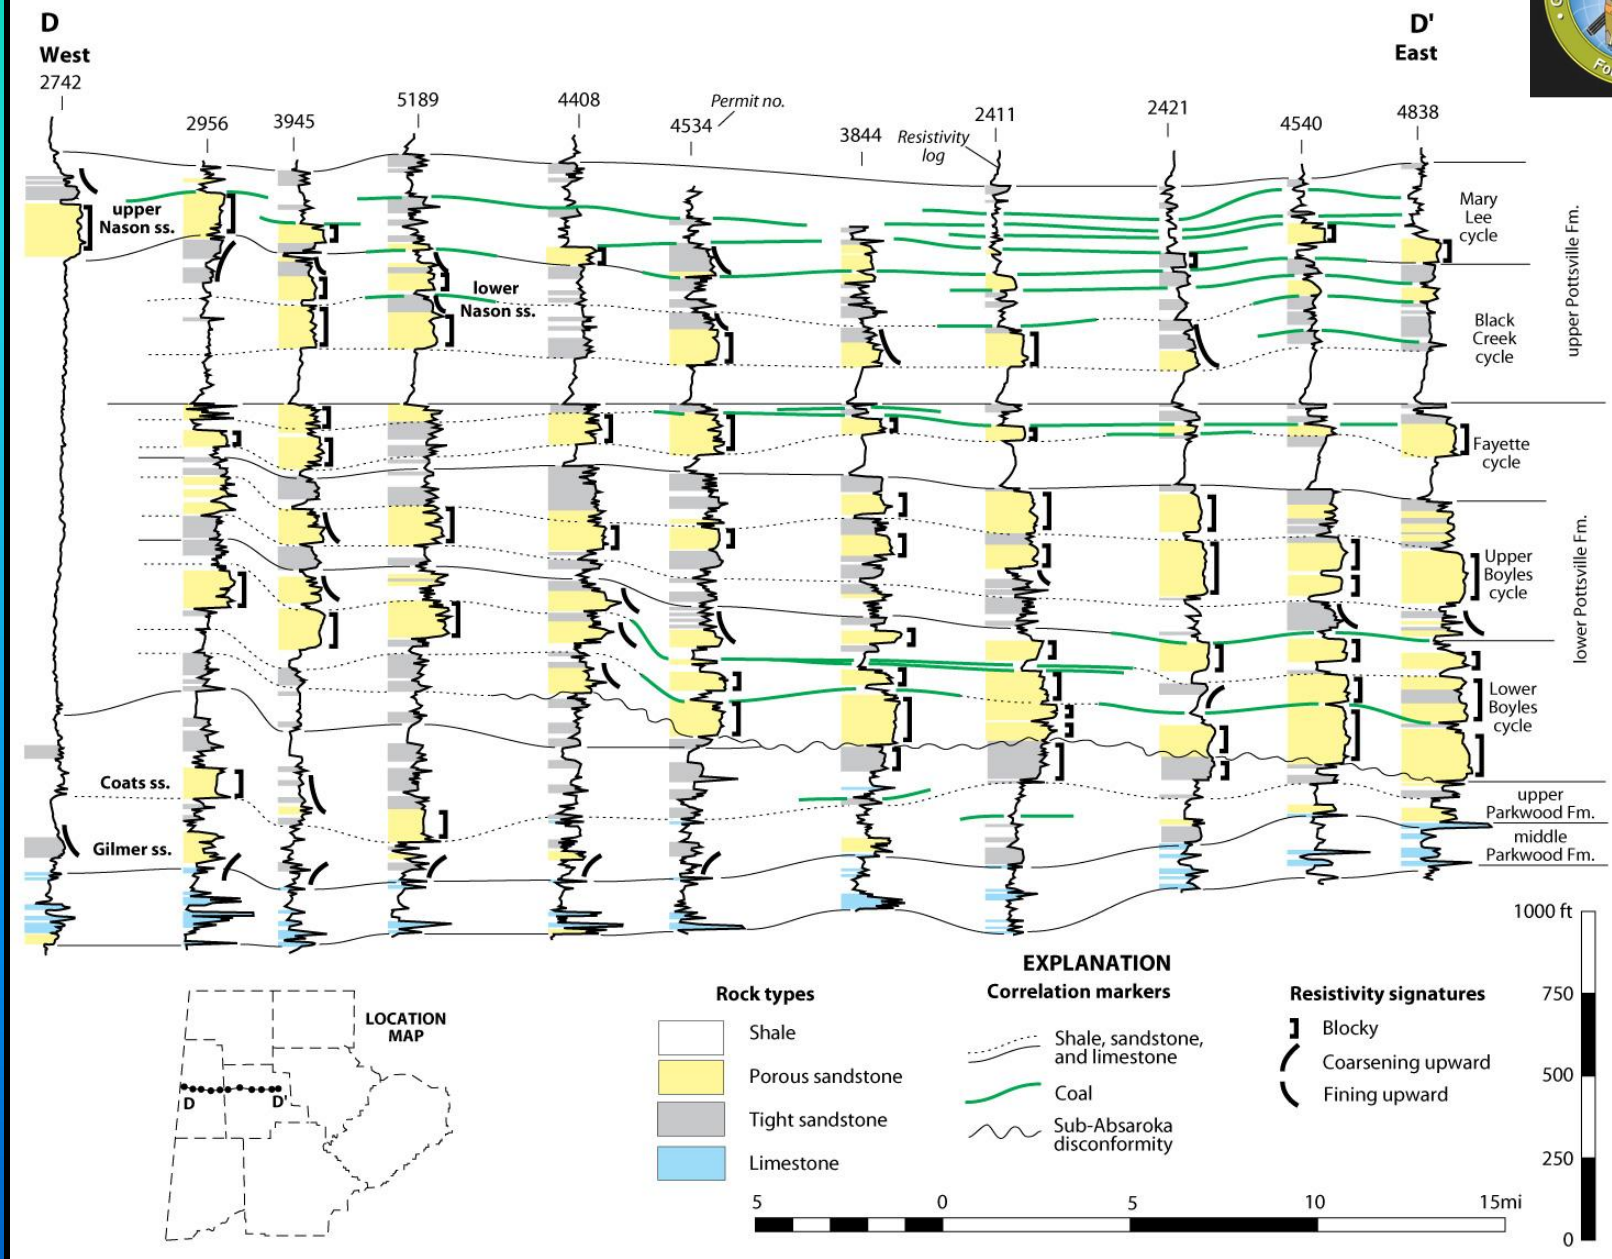

# REGIONAL STRATIGRAPHY

# REGIONAL STRATIGRAPHY

# EXPLORATORY WELL

- ✓ Depth ~8000 ft (TD est. in Cambrian Dolomite)
- ✓ Extensive log suite
- ✓ Multiple coring points (full core and sidewall)
- ✓ Conventional core analysis
- ✓ Tight-rock analysis
- ✓ Geophysical testing (VSP, microseismic, borehole gravity)
- ✓ Injectivity testing
- ✓ Mini-frac testing

# SEISMIC REFLECTION

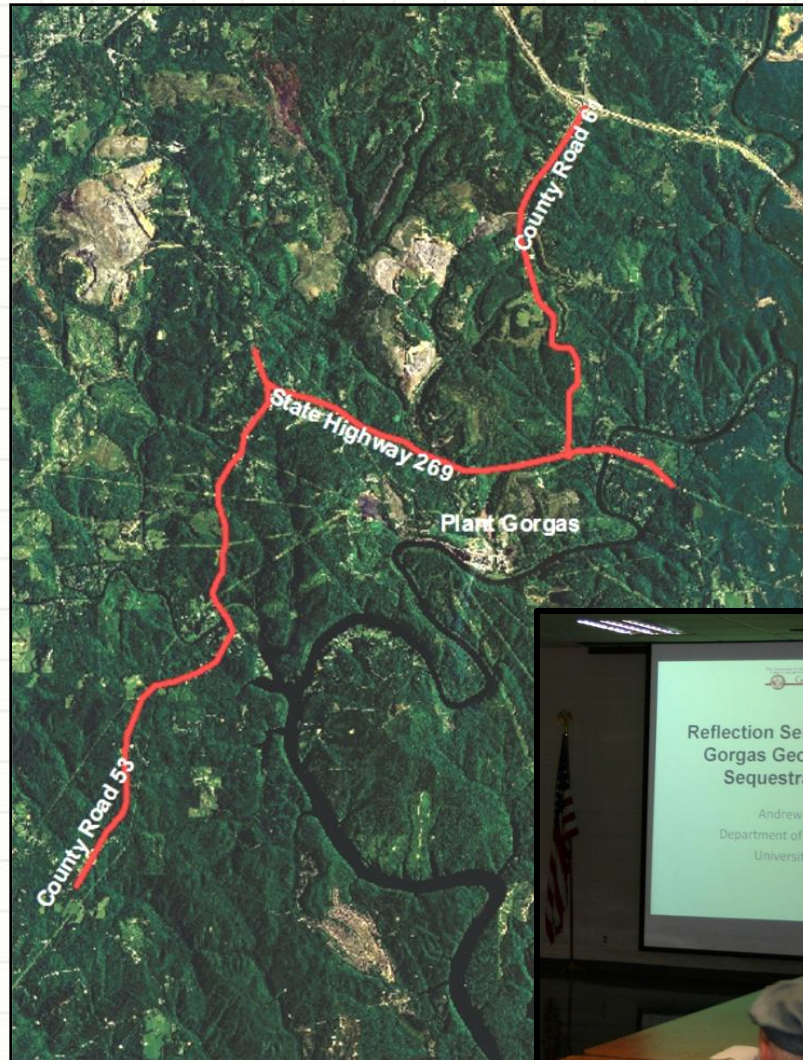

- ✓ 10 miles of seismic reflection along County and State Highways
- ✓ Two perpendicular lines configured to image regional structure
  - Appalachian folds
  - Thin-skinned normal faults

# SEISMIC REFLECTION

- ✓ Nominal 10 foot receiver interval
- ✓ 40 foot group interval (variable)
- ✓ 120 foot source interval
- ✓ 3 Hemi-44 truck mounted vibrators
- ✓ Max offset along a 5 mile line of 24,600 foot
- ✓ Processing though depth migration
- ✓ Inversion with well data
- ✓ Amplitude versus offset analysis
- ✓ Detailed attribute analysis

# SEISMIC TOMOGRAPHY

- ✓ 100-200 “Texan” single channel geophones deployed during Vibroseis survey
- ✓ Data will be used to build a regional velocity model
- ✓ Extends seismic results to 3-D (though at lower resolution)
- ✓ Important for constraining reservoir models beyond seismic reflection coverage
- ✓ Potential for additional seismic anisotropy data

# ADDITIONAL GEOPHYSICS

- ✓ Multi-offset VSP
  - Correlation of well and seismic data
  - Depth conversion
  - Identify multiples in conventional seismic data
- ✓ Synthetics
- ✓ Borehole gravity
  - Density, porosity and heterogeneity away from the borehole
- ✓ Microseismic monitoring during water injection
  - Little seismicity expected
  - Constrain regional stress state and fracture direction and compare results with other methods
  - Identify potential cross-formational flow

# RESERVOIR SIMULATION

- ✓ Integrate continuum and discrete reservoir elements
- ✓ Attempt to identify characteristics (beyond porosity and permeability) that appear to have substantial impact on CO<sub>2</sub> sequestration

- ✓ Assess storage capacity
- ✓ Estimate CO<sub>2</sub> injection rates
- ✓ Assess long-term viability of storage

# RESERVOIR SIMULATION

- ✓ The assessment of geochemical issues requires investigation at pore scale
- ✓ Determining long-term viability requires basin-scale calculations
- ✓ Simulator must be able to handle large numbers of cells ( $> 10^6$ ) with many unknowns per cell
- ✓ The simulation team has developed a very flexible simulator and visualization framework
- ✓ The framework required the slight modification of a petroleum industry standard equation-of-state formulation
- ✓ BSD-style license, so anyone can use or modify the code
- ✓ Code base utilizes cutting-edge hardware; e.g., GPU cards

# PRECIPITATION/DISSOLUTION

- ✓ Goal: Understand Long-term impact of CO<sub>2</sub> injection on mineral dissolution mineralization and control both near the injection and into the formation

- ✓ Study to date
  - Baseline calcite dissolution
  - Effects of additives: phosphonates and surfactants
  - Surfactant desorption experiment
  - Model has been proposed to predict surfactant behavior

# SURFACTANT RESEARCH

Calcite dissolution, blank comparison

Modeled dissolution slope versus inhibitor concentration

Desorption of Tween 20 from calcite

- Blank dissolution was established
- Calcite dissolution with surfactant was fitted with a Langmuir type equation
- Desorption from treated calcite is slow for prolonged effectiveness

# PRECIPITATION/DISSOLUTION

- ✓ Laboratory simulations of mineral dissolution and precipitation:
  - Near wellbore flow and reaction time
  - Intermediate distances and reaction time, temperature and pressure
  - Long term reaction of CO<sub>2</sub> injections
  - Effects of additives in controlling mineral dissolution and precipitation
  - Mixed ion effects and solid solution
- ✓ Mathematical simulation
  - Modeling with Phreeq C, ScaleSoftPitzer, and others

# SCHEDULE

RICE

## Progress

- ✓ Geologic framework
- ✓ Assessment underway
- ✓ Site selected
- ✓ Seismic being permitted
- ✓ Simulation tools
- ✓ Containment analysis
- ✓ Dissolution and mineralization
